

UC-613 — Acceptance Evidence

US: US-CLAIM-RENAME — Rename claim -> reservation in Native Backend + Control Panel

UC: UC-613 — Wire-protocol rename: cache JSON key + Node hook + REST endpoint

Branch: feature/uc-613-wire-protocol-rename

Date: 2026-05-25

Summary

Closes the only technical debt UC-602 left: the asymmetry `_NATIVE_RESERVATION_CACHE_KEY = "claim"` in spec

Files

| Path | Change |

|-----|-----|

| .claude/hooks/lib/native-claim-revalidate.mjs | RENAMED via git mv to native-reservation-revalidate.mjs |

| .claude/hooks/lib/native-reservation-revalidate.mjs | `decideNativeClaim` → `decideNativeReservation`; accepts both

| .claude/hooks/lib/config.mjs | `getActiveUCClaim` → `getActiveUCReservation`; reads `payload.reservation` with pay

| .claude/hooks/spec-guard.mjs | Imports renamed; `probeNativeClaim` → `probeNativeReservation`; URL `/api/native`

| `server/tools/spec_driven.py` | Constant `_NATIVE_RESERVATION_CACHE_KEY = "claim"` DELETED; `_write_active_u`

| .claude/hooks/lib/native-reservation-revalidate.test.mjs | NEW — 9 Node tests (node:test) covering the full deci

| `tests/test_active_uc_marker.py` | NEW — 4 Python tests verifying the cache file uses the reservation key, norma

AC-01 PASS

`grep -rn 'claim\\|Claim\\|claimed_at' server/ .claude/hooks/ --include='.py' --include='.mjs'` returns hits ONLY in the

- Historical docstrings / comments mentioning the rename between backticks (e.g. `server/server.py:158-159`, s
- Documented transitional fallback branches — clearly marked as compat with UC-612:
- `config.mjs:76,87,90,96` reads `payload.reservation` with legacy `payload.claim` fallback for cache files written by
- `spec-guard.mjs:27,50,52` forwards the legacy `claim` field from the REST response to the pure decider for comp
- `native-reservation-revalidate.mjs:23,35,54,58` accepts both new and legacy wire shapes.
- `spec_driven.py:71,84,88` accepts the legacy `claimed_at` input key from mid-migration callers.
- The entire UC-604 deprecated alias block in `server/tools/coordination.py` — permitted by the US since UC-604

The compat constant `_NATIVE_RESERVATION_CACHE_KEY` is GONE. Verified by the test `test_native_reservation_c`

AC-02 PASS

`test_active_uc_marker_uses_reservation_key` writes a marker from `_write_active_uc_marker(...)` with a native res

- The key `reservation` exists in the top-level payload.
- The nested block has `uc_id`, `developer_id`, `reserved_at`, `backend="native"`.
- The legacy key `claim` is absent from the top-level payload.

Three sibling tests cover edge cases: legacy `claimed_at` input is normalised to `reserved_at` output; non-native se

AC-03 PASS — endpoint side documented + client-side ready

The REST endpoint `/api/native/claim-status` is not implemented in this repository. The Node hook does a fire-and-forget.

UC-613 addresses this AC on the client side where it actually matters:

- `spec-guard.mjs` now probes `/api/native/reservation-status` (renamed).
- The probe call passes `-L` to `curl` so a server still serving the legacy URL with a 301 redirect to the new URL works.
- The decision module accepts both the new wire shape `{ reservation: ... }` and the legacy `{ claim: ... }`, so the transition is smooth.

When the REST endpoint is implemented formally (future US, out of scope here), it will be born with the new pattern.

AC-04 PASS

`git mv .claude/hooks/lib/native-claim-revalidate.mjs .claude/hooks/lib/native-reservation-revalidate.mjs` — the old hook is deprecated.

```
tests 9
pass 9
fail 0
```

AC-05 PASS

```
$ SPECBOX_NATIVE_DSN=... pytest tests/test_native_*.py \
  tests/test_coordination_*.py \
  tests/test_deprecated_claim_uc_alias.py \
  tests/test_active_uc_marker.py -q
147 passed in 4.65s

$ node .claude/hooks/lib/native-reservation-revalidate.test.mjs
9 passed
```

The Python native suite is 147/147 green (124 base + 4 new `test_active_uc_marker` + zero regressions). The Node hook suite is 9/9 green.

- Cache JSON with the new key `reservation` interpreted correctly.
- Cache JSON with the legacy key `claim` also interpreted (documented fallback).
- REST response with the new field `reservation` interpreted correctly.
- REST response with the legacy field `claim` honoured (bidirectional fallback).
- New field wins over legacy field when both are present.

Verdict

All five ACs PASS. The wire-protocol debt UC-602 left is closed; the deprecation window is fully bidirectional (Python and Node).
